Pathway Analysis Gene Ontology (GO) genesets	9 15 16

Here we will perform a complete RNASeq analysis from counts to pathways and biological interpretation.

The data for for hands-on session comes from GEO entry: GSE37704, which is associated with the following publication:

Trapnell C, Hendrickson DG, Sauvageau M, Goff L et al. "Differential analysis of gene regulation at transcript resolution with RNA-seq". Nat Biotechnol 2013 Jan;31(1):46-53. PMID:

23222703 The authors report on differential analysis of lung fibroblasts in response to loss of the developmental transcription factor HOXA1.

Required packages

```
library(DESeq2)
library(AnnotationDbi)
library(org.Hs.eg.db)
library(pathview)
library(gage)
library(gageData)
```

Data Import

```
colData <- read.csv("GSE37704_metadata.csv", row.names = 1)
countData <- read.csv("GSE37704_featurecounts.csv", row.names = 1)</pre>
```

```
head(colData)
```

```

ann 4000m4

Make the columns and rows the same in the datasets

Q. Complete the code below to remove the troublesome first column from count-Data.

Check the correspondence of colData rows and countData columns.

```
rownames(colData)
```

```
[1] "SRR493366" "SRR493367" "SRR493368" "SRR493369" "SRR493370" "SRR493371"
```

remove the troublesome first column so we match the metadata

```
counts <- countData[,-1]</pre>
```

```
rownames(colData) == colnames(counts)
```

[1] TRUE TRUE TRUE TRUE TRUE TRUE

Remove zero count genes

Q. Filter countData to exclude genes (i.e. rows) where we have 0 read count across all samples (i.e. columns).

We will have rows in **counts** for genes that we can not say anything about because they have zero expression in the particular tissue we are looking at.

```
head(counts)
```

	SRR493366	SRR493367	SRR493368	SRR493369	SRR493370	SRR493371
ENSG00000186092	0	0	0	0	0	0
ENSG00000279928	0	0	0	0	0	0
ENSG00000279457	23	28	29	29	28	46
ENSG00000278566	0	0	0	0	0	0
ENSG00000273547	0	0	0	0	0	0
ENSG00000187634	124	123	205	207	212	258

If the rowSums() is zero, then a given gene (i.e. row) has not count data and we should exclude these genes from further consideration.

```
to.keep <- rowSums(counts) != 0
cleancounts <- counts[to.keep,]</pre>
```

Q. How many genes so we have left?

```
nrow(cleancounts)
```

[1] 15975

Setup for DESeq object for analysis

Warning in DESeqDataSet(se, design = design, ignoreRank): some variables in design formula are characters, converting to factors

Run DESeq analysis

```
dds <- DESeq(dds)
estimating size factors
estimating dispersions</pre>
```

```
gene-wise dispersion estimates

mean-dispersion relationship

final dispersion estimates

fitting model and testing
```

Extract the results

```
res <- results(dds)
head(res)</pre>
```

```
log2 fold change (MLE): condition hoxa1 kd vs control sirna Wald test p-value: condition hoxa1 kd vs control sirna DataFrame with 6 rows and 6 columns
```

```

```

Q. Call the summary() function on your results to get a sense of how many genes are up or down-regulated at the default 0.1 p-value cutoff.

summary(res)

```
out of 15975 with nonzero total read count
adjusted p-value < 0.1
LFC > 0 (up) : 4349, 27%
LFC < 0 (down) : 4396, 28%
outliers [1] : 0, 0%
low counts [2] : 1237, 7.7%
(mean count < 0)
[1] see 'cooksCutoff' argument of ?results
[2] see 'independentFiltering' argument of ?results</pre>
```

Add Gene annotation

Q. Use the mapIDs() function multiple times to add SYMBOL, ENTREZID and GENENAME annotation to our results by completing the code below.

'select()' returned 1:many mapping between keys and columns

'select()' returned 1:many mapping between keys and columns

'select()' returned 1:many mapping between keys and columns

log2 fold change (MLE): condition hoxa1 kd vs control sirna Wald test p-value: condition hoxa1 kd vs control sirna DataFrame with 10 rows and 9 columns

Save my results to a CSV file

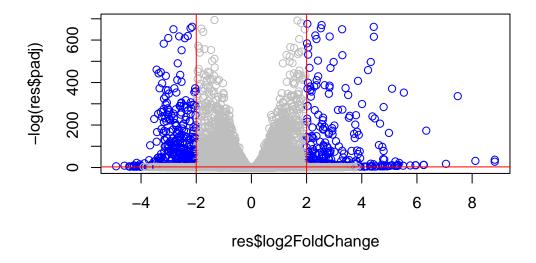

Q. Reorder these results by adjusted p-value and save them to a CSV file in your current project directory.

```
res = res[order(res$pvalue),]
write.csv(res, file="deseq_results.csv")
```

Result visualization

```
mycols = rep("grey", nrow(res))
mycols[res$log2FoldChange <= -2] <- "blue"
mycols[res$log2FoldChange >= 2] <- "blue"
mycols[res$padj >= 0.05] <- "grey"

plot(res$log2FoldChange, -log(res$padj), col=mycols)
abline(v=-2, col="red")
abline(v=2, col="red")
abline(h=-log(0.05), col="red")</pre>
```

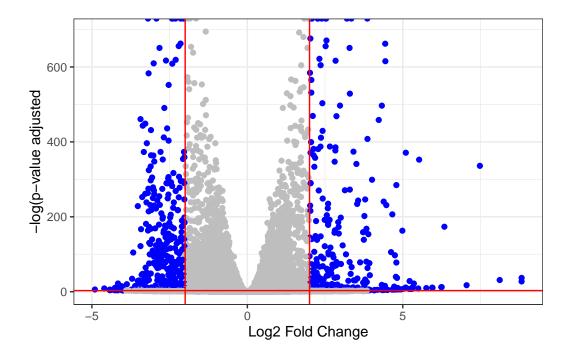

Q. Improve this plot by adding color and axis labels

```
library(ggrepel)
```

Loading required package: ggplot2

```
ggplot(as.data.frame(res)) +
  aes(x=log2FoldChange, -log(padj)) +
  geom_point(col = mycols) +
  geom_vline(xintercept = c(-2, 2), col="red") +
  geom_hline(yintercept = -log(0.05), col="red") +
  labs(x="Log2 Fold Change", y="-log(p-value adjusted") +
  theme_bw()
```

Warning: Removed 1237 rows containing missing values or values outside the scale range (`geom_point()`).

Pathway Analysis

```
# sigmet.idx.hs index the signaling and metabolic pathways in keggs.sets.hs
# kegg.sets.hs has elements representing member gene ENTREZ IDs
data(kegg.sets.hs)
data(sigmet.idx.hs)
```

Focus on signaling and metabolic pathways only and exclude other pathways that are not of

```
kegg.sets.hs = kegg.sets.hs[sigmet.idx.hs]
# Look at the first 3 pathways in the new dataset
head(kegg.sets.hs, 3)

Reactome analysis online

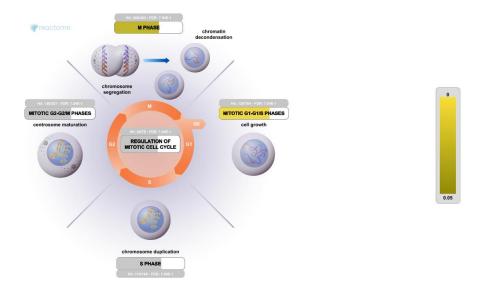

We need to make a little file of our significant genes that we can upload to the reactome webpage:

```
# extract genes with the statistical significance less than 0.05.
sig_genes <- res[res$padj <= 0.05 & !is.na(res$padj), "symbol"]
print(paste("Total number of significant genes:", length(sig_genes)))</pre>
```

[1] "Total number of significant genes: 8147"

```
sig_genes[6]
```

```
# create the file for the significant genes
write.table(sig_genes, file="significant_genes.txt", row.names=FALSE, col.names=FALSE, quote
```

Q: What pathway has the most significant "Entities p-value"? Do the most significant pathways listed match your previous KEGG results? What factors could cause differences between the two methods?

The Cell Cycle has the most significant entities p-value. The Cell cycle is the most significant result in both methods, however, the other results are different. The second method using Reactome has pathways that are more specific and are apart of a larger pathway. The results listed in the KEGG are more general and broad.
